/note="Vector: Uni-ZAP XR; ecotype: Landes; The library was made from the roots of 6 weeks old seedlings grown in hydroponic conditions. A three weeks drought stress treatment was applied by lowering the osmotic potential of the nutrient solution to -0.45 MPa using 170 g/l of genotypes were used. Oligo-dT primed cDNA was directionally cloned into the EcoRI-XhoI lambda-ZAP vector arms and mass-excised to form a pBluescript phagemid"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  558 bp mRNA linear EST 25-FEB-2003 CDNA clone PP088E04, mRNA sequence.

| clone lib_rary was prepared from polyth-RNA from drought-stressed loblolly pine (Finus taeda) roots. Water was withheld from ramet clones until predawn needle water potential reached -1.75 MPa. On day 7 roots were harvested for RNA isolation. Double-stranded cDNA was cloned unidirectionally into pSilliBO. Inserts excised with ECORI (5' end) and Xhol (3' end)."

RNA prepared and library constructed by W. Walter Lorenz, School of
RNA prepared and library constructed by W. Walter Lorenz, School of
Forestry, University of Georgia; plant material prepared at the
University of Florida; sequencing done in the Laboratory for
Genomics and Bioinformatics, University of Georgia. Sequence ends
have been trimmed to exclude vector and regions below Phred quality
16. Three-prime sequences are presented as their reverse complement
and have been trimmed to exclude polyA.
Seq primer: JENREV (CAGGAAACAGCTATGACC).

/note="Vector: BlueScript SK; Site_1: Eco RI; Site_2:
XhoI; The library is from early (spring) wood, taken from
three six-year old trees (trree different genotypes), in
the juvenile phase. These trrees were induced to form
compression wood by bending to a 45 degree angle and tying
them to the ground. Differentiating xylem was harvested
from the bottoms of the inclined stems, and a mixture of
all three genotypes was used for the library. Oligo-dr
primed cDNA was directionally cloned into the EcoRI-XhoI
BlueScript SK vector arms. NOTE: The sequences contain a
'CNNA adapter' between the EcoRI site and the start of the
EST. The adapter sequence is 'AATTCGGCACGAG'."

ground. Differentiating xylem was harvested from the sides of the inclined stems, and a mixture of all three genotypes was used for the library. Oligo-dT primed cDNA was directionally cloned into the EcoRI-Ahol BlueScript SK between the EcoRI atte and the start of the EST. The adapter adapter sequence is 'AATTCGGCACGAG'."

/note="Vector: Uni-ZAP XR; ecotype: Landes; The library
was made from the roots of 6 weeks old seedlings grown in
hydroponic conditions. A three weeks drought stress
treatment was applied by lowering the osmotic potential of
the nutrient solution to -0.45 MPa using 170 g/l of
polypethylene glycol as an osmoticum. A mixture of
genotypes were used. Oligo-dT primed cDNA was
directionally cloned into the EcoRI-XhoI lambda-ZAP vector
arms and mass-excised to form a pBluescript phagemid"

/notes of a twelve year old tree in the transitional phase from juvenile wood to mature wood production. NOTE: The agequences contain a 'cDNA adapter' between the EcoRI site and the start of the EST. The adaptersequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Email: mmpratt@uga.edu

RNA prepared and library constructed by W. Walter Lorenz, School of
Forestry, University of Georgia; plant material prepared at the
University of Florida; sequencing done in the Laboratory for
Genomics and Bioinformatics, University of Georgia. Sequence ends
have been trimmed to exclude vector and regions below Phred quality
16. Three-prime sequences are presented as their reverse complement
and have been trimmed to exclude polyA.
Seq primer: Mi3-21 (TGTAAAACGACGCCAGT)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RIDR3_8 B06.bl A022 Loblolly pine roots recovering from drought DR3 Pinus taeda cDNA clone RIDR3_8 B06_A022 3', mRNA sequence. (bases 1 to 505)
incre"vector: pSL1180; Site 1: EcoRI; Site 2: XhoI; The library was prepared from poIyA+ RNA from loblolly pine library was prepared from poIyA+ RNA from drought. Water was withheld from ramer clones until predawn needle water potential reached -1.75 MPa. Plants were well watered on day 7 and allowed to recover for 2 days, at which time roots were harvested for RNA isolation. Double-stranded cDNA was cloned unidirectionally into pSL1180. Inserts excised with EcoRI (5' end) and XhoI (3' end)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

/ Lone library is from early (spring) wood, taken from three six-year old tress (three different genotypes), in the juvenile phase. These trees were induced to form side wood by bending to a 45 degree angle and tying them to the ground Differentiating xylem was warvested from the sides of the inclined stems, and a mixture of all three genotypes was used for the library. Oligo-dT primed cDNA was directionally cloned into the EcoRI-Xinol BlueScript SK vector arms. NOTE: The sequences contain a 'CDNA dapter' between the EcoRI site and the start of the EST. The adapter sequence is 'AATTCGGCACGAG'."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      æ

RNA prepared and library constructed by W. Walter Lorenz (School of RNA prepared and library constructed by W. Walter Lorenz (School of Forest Resources, University of Georgia); plant material prepared by Craig Zimmermann (School of Forest Resources, University of Georgia) using rooted cuttings provided by the Forest Biology Research Cooperative (FBRC) and the CLONES project a the University of Florida; sequencing done in the Laboratory for Genomics and Bioinformatics, University of Georgia. Sequence ends have been trimmed to exclude vector and regions below Phred quality and have been trimmed to exclude polyA.

Seq primer: M13-21 (TGTAAAACGACGGCCAGT)
POLYA=Yes.

            pallescript sequence. The vector was then packaged using pallescript sequence. The vector was then packaged using Gold gigapackaging extracts. Library was grown in XIIBlue MRF' cells and amplified. The library was grown in XIIBlue MRF' cells and splitting. The library was grown in XIIBlue exision using Stratagens 'Mass excision kit' that uses exassist as a helper phage that releases the pBluescript sequence and circularises it as single stranded plasmids that are then packaged (by helper phage) and secreted out of the host cell as phagemids. Solk cells were transformed with phagemids and the library was plated out on LB-amp plates to select for transformants. Approximately 1,000,000 colonies were grown and recovered. The double stranded plasmid library was recovered by using Quiagen Midi prep kit. 2 micro grams of each library were used to transform DH10B cells by electroporation."

/ Organism "Chlamydomonas reinhardtii"
/ Mol_type="mRNA"
/ Mole="wercor: glauescript II SK-; Site_I: EcoRI; Site_2:
/ Mole="wercor: plauescript William J. Shell and John Davies:
Strain 21gr cells (CC-1690; mating type plus) and strain
6145c cells (CC-1691; mating type plus) that had been
growing on a light-dark cycle (13:11 L/D) in R-medium
(Sager and Granick) were separately transfered into
nitrogen-free medium at 8 hours into the light period
PolyA mRNA was purified from each sample every 2 hours for
the next 18 hours. The mRNA was pooled and used for cDNA
synthesis. The cDNA was directionally cloned into lambda
Sap II (Stratagene) in the EcoRI (5) and XhoRI (3))
sites. pBluescript II SK- plasmids were excised from the
lambda ZAP clones by superinfection with ExAssist
(Stratagene) phage. The library was normalized using
method 4 describbed in Bonaldo et al., (1996) Genome
Research 6: 791-806."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      BW340838 Yutaka Satou unpublished cDNA library, embryo whole animal Ciona intestinalis cDNA clone ciem816k14 5', mRNA sequence. Patent No. US20020165178A1

GENERAL INFORMATION:

APPLICANT: Schetter, Christian

APPLICANT: Bratzler, Robert L.

APPLICANT: Petersen, Deanna M.

TITLE OF INVENTION: IMMUNOSTIMULATORY NUCLEIC ACIDS FOR THE

TITLE OF INVENTION: TREATMENT OF ANEMIA, THROMBOCYTOPENIA, AND NEUTROPENIA

TITLE OF INVENTION: TREATMENT OF ANEMIA, THROMBOCYTOPENIA, PLIC REFERENCE: C1041/7014 (ANG)

CURRENT FILING DATE: 2001-06-28

PRIOR APPLICATION NUMBER: US 60/214,368

PRIOR FILING DATE: 2000-06-28

NUMBER OF SEQ ID NOS: 133

SOFTWARE: FastSEQ for Windows Version 3.0

SEQ ID NO 5

LENGTH: 15
